

ROS-2

Workspace: In ROS2, a workspace is a central folder used to organize and develop your robot's software.

This directory serves as the primary location for all:

- code
- Data files
- Configuration scripts

Essentially, it acts as the folder foundation for your specific robotic project, ensuring your files are structured and accessible for building and running your robot's software.

Workspace

```
Echo "source ~/ros2_ws/install/setup  
.bash" >> ~/.bashrc
```

our workspace can be found anytime
we open a new terminal window

src

build

install

log

source
code
of
project.

temporary
store files
while
compiling
and putting
your software
together.

finished
ready to use
software after
a successful
build.

keeps track
of the build
process, which is
extremely useful
for debugging and
fixing issues when
a build fails.
