

colcon build: The colcon build command is the standard tool used in ROS2 to compile and organise your robotic software projects.

→ Functionality: It gathers all the different pieces of your source code (located in the src folder) and compiles them together, making the software ready to use for your robot.

→ Execution: You must run this command from the root of your workspace whenever you make additions or changes to your source code.

→ Result: After running the command, ROS2 generates three primary directories: build (temporary files), install (finished software) and log (build process tracking).

cd ~/ros2_ws/

colcon build

echo "alias build='cd ~/ros2_ws && colcon build'">> ~/.bashrc && source ~/.bashrc
--

This command adds an alias called "build" to your .bashrc file. Now you can type build to build packages
